Raising the bar with technology and innovation

When Stefan and Anné Pretorius established Katlego Sitrus more than a decade ago, they decided to re-evaluate everything they knew about farming. This involved introducing new technology to improve production processes. Wilma den Hartigh reports.

Stefan and Anné Pretorius established Katlego Sitrus (Katlego), a citrus farming and exporting business, 11 years ago. To improve their competitive advantage, they gradually introduced new technologies into their operation, and have since seen improvements in fertiliser application efficiency, pest control and water utilisation.

While Stefan studied mechanical engineering, he is not a newcomer to agriculture, as he spent his childhood on his father’s citrus farm. His engineering background has also been particularly useful as it helps him identify areas where technology can be applied to upgrade processes. For example, he designed and constructed a tipper, which tips bins and performs the first fruit wash, for less than R100 000. These machines can cost up to R700 000 each.

Katlego Sitrus is one of three farms situated near Marble Hall in Limpopo. “After studying, I worked on mining projects, but in 2003 I became more involved in the [family] farm on a part-time basis. Then in 2005, I bought my first farm,” recalls Stefan.

Katlego Sitrus has 188ha of established citrus and 54ha of new plantations, and exports 80% of its crop (about 250 000 cartons) to India, Ireland, Taiwan, China, Hong Kong and the United Arab Emirates. Produce is exported from May to September, and Katlego’s packhouse has the capacity to process up to 170t/day.

Traditional Valencia, as well as other Valencia varieties – Delta, MidKnight, and Turkey – are cultivated. Navel varieties, namely Bahianinha, Cara Cara and Palmer, are also produced, while an orchard of Eureka lemons was recently established.

FAST FACTS

Katlego Sitrus has developed an app designed to speed up and improve pest identification and treatment.

Stefan Pretorius says that precision irrigation is the basis of successful production and fertiliser application.

According to Anné Pretorius, keeping track of consumer trends is crucial.

ABOVE: Stefan and Anné Pretorius, owners of Katlego Sitrus, a citrus farming and exporting business, say that consistent quality is essential to remain competitive in the export markets. Katlego ensures that it produces and packs to internationally accepted high standards.

PEST CONTROL

Katlego Sitrus recently developed a scouting smartphone app to speed up response time to pests and diseases. Using the app, a scout can take a photograph of the pest or disease on the tree or plant, then upload the image to a database in real time for immediate identification. A relevant chemical treatment can then be selected and quickly
commercialise it and get various citrus bodies and organisations involved," he explains.

Katlego has also experimented with biological pest control, and have used Trichogramma parasitic wasps, which are effective against false codling moth (FCM) eggs. While the wasps were indeed effective, the programme was too expensive for use on a commercial scale.

"We believe farmers should first focus on chemical solutions and use biological methods as support," he says.

A focus on orchard hygiene has also reduced Katlego's reliance on chemical programmes to control FCM.

"We remove fruit that has fallen from trees three times a week as it's the hosts for the larvae. This has helped us save thousands of rands each year on chemicals."

**IRRIGATION IMPROVEMENTS**
Katlego no longer uses centre pivots, and every season more micro sprayers are replaced with drip irrigation. This has reduced water usage and improved fertiliser application, as well as efficacy. "Efficient and effective irrigation is the basis of good production, and farmers should always get this right first. If a tree is getting the correct amount of water, the fertiliser will also work as it should."

While dripper lines in most drip irrigation systems can

**ORCHARD HYGIENE REDUCES RELIANCE ON SPRAYING PROGRAMMES**

Stefan says that good agricultural practices will always be effective in reducing pest incidences. He adds that experience has taught him that it is more cost-effective to invest in high-quality sprayers that administer chemicals with greater precision, as this reduces the need for additional pest control strategies.

---

**Upgrading packing facilities**

Two years ago, Katlego Citrus received a grant from the Department of Trade and Industry Manufacturing Competitiveness Enhancement Programme. This was used to upgrade its packhouse infrastructure and buy machinery to meet export requirements. A portion of the grant was used to buy a new sizer machine, which improves fruit sorting consistency.

"Without this, one can't compete in the international export market. We're very thankful for this grant," Stefan says.

become blocked, thereby affecting water supply, the lines in Katlego's system have been designed in such a way that they can be flushed to eliminate build-up and dislodge blockages before irrigating.

EXPORTS AND STRONG BRANDING
In 2010, Stefan began selling directly to export markets, instead of through exporting companies. This approach is more cost-effective, as he does not have to pay a portion of his profits to an agency. Katlego is exporting directly as customers deal with the producer. Creating a strong brand identity is also important in overseas supermarkets. Katlego has three brands: the Purple Orange, the Pink Orange and the Purple Lemon.

Anné stresses that it is essential to be informed about changing consumer demands. A major trend is the move towards experiential purchasing; consumers increasingly use their smartphones to guide their shopping decisions by comparing prices and product reviews.

TECHNOLOGY INCREASINGLY GUIDES CONSUMERS' SHOPPING DECISIONS

thus also better able to retain control over pricing and brand. Stefan explains it is important to understand the product being exported, regardless of the export method. "To export fruit successfully, you need to produce and pack efficiently and to a sustainably high standard." While Stefan is in charge of production, Anné has played a central role in establishing good relationships with buyers – essential when All Katlego's fruit therefore have stickers with a quick-response barcode. Consumers can scan the barcode with their smartphones, then access video clips about Katlego's production and packaging processes.

"This brings the consumer closer to the fruit they're buying, and educates people about the production process," she says.

While the drought resulted in less available fruit for export, Stefan and Anné expect that yield will improve again as normal rainfall patterns return. "Our story proves that new producers can enter the sector. We gradually built our business, and we're now at the point where we have to increase the capacity of our packhouse again," says Anné.

Stefan says that he always questions conventional citrus farming processes, and likes to teach himself new things. "Advice is available, which you need to listen to, but always make your own, educated decisions."

Childcare facilities for farmworkers' children

Anné says that the experience of raising their own children made her and Stefan more aware of the lack of childcare facilities for farmworkers.

"We realised that many women in the community can't take up formal employment because they have no one to take care of their young children."

In 2012, Katlego Citrus established Lesedi Day Care, a non-profit organisation. Between 36 and 52 children, up to the age of five, attend at various times of the year.
